

Heat — Lesson 2

ICSE Class 7 Physics · 10 MCQs · 1 mark each · Name: _____ Date: _____

Syllabus: Effects of heat and thermal expansion of solids, liquids and gases.**Instructions:** Each question has one correct option. Tick or circle the letter of the best answer. Attempt all questions.**1. When a metal ball is heated, which of these increases?**

- A. its mass
- B. its size (it expands)
- C. its weight
- D. its colour permanently

2. On strong heating, ice changes to water and then to steam. This shows heat causing:

- A. a change of state
- B. a chemical change
- C. a change of colour
- D. expansion only

3. For the same rise in temperature, which of these expands the least?

- A. an iron rod
- B. alcohol
- C. water
- D. air

4. A metal lid stuck on a glass jar opens more easily after running it under hot water because the metal lid:

- A. contracts
- B. melts
- C. expands more than the glass
- D. becomes lighter

5. A bimetallic strip is made of two metals that, on heating, expand:

- A. not at all
- B. by different amounts
- C. only when bent
- D. equally

6. Overhead wires are kept slightly loose so that they do not snap on a cold day, when they:

- A. conduct
- B. melt
- C. expand
- D. contract

7. A dented table-tennis ball regains its shape in hot water because the air inside it:

- A. expands and pushes the dent out
- B. escapes
- C. turns to liquid
- D. contracts

8. When a flask completely full of water is heated, the water level first falls slightly and then rises because:

- A. this never happens
- B. water evaporates
- C. water contracts
- D. the flask expands first, then the water expands even more

9. Bottles of liquid are never filled right up to the brim because on warming the liquid will:

- A. contract
- B. expand and may overflow or burst the bottle
- C. stay the same
- D. freeze

10. The change of a liquid into vapour on heating is called:

- A. freezing
- B. condensation
- C. vaporisation
- D. melting

Answer Key

1. B

2. A

3. A

4. C

5. B

6. D

7. A

8. D

9. B

10. C
