

Life Processes in Animals

Science — Biology · Class 7 · Max Marks: 25 · Time: 45 min

Section A — Multiple Choice Questions ($1 \times 8 = 8$)

1. The process by which digested food passes through the intestinal wall into the blood is called:

- A. digestion
- B. ingestion
- C. egestion
- D. absorption

2. A cow brings swallowed grass back into its mouth and chews it again. This partly digested food is called:

- A. bile
- B. cud
- C. mucus
- D. saliva

3. In the human body, most of the digested food is absorbed in the:

- A. small intestine
- B. stomach
- C. mouth
- D. large intestine

4. Amoeba captures its food using finger-like extensions called:

- A. flagella
- B. cilia
- C. pseudopodia
- D. villi

5. The correct order of the steps in animal nutrition is:

- A. absorption → ingestion → egestion
- B. digestion → ingestion → absorption → egestion
- C. ingestion → egestion → digestion
- D. ingestion → digestion → absorption → assimilation → egestion

6. Bile, which helps in the digestion of fats, is produced by the:

- A. liver
- B. stomach
- C. small intestine
- D. pancreas

7. During respiration, the gas taken in and the gas given out are respectively:

- A. oxygen and nitrogen
- B. carbon dioxide and oxygen
- C. oxygen and carbon dioxide
- D. carbon dioxide and nitrogen

8. Fish can breathe under water because they possess special respiratory organs called:

- A. lungs
- B. gills
- C. skin folds
- D. tracheae

Section B — Fill in the Blanks ($1 \times 5 = 5$)

1. The muscular tube that pushes food from the mouth to the stomach is the _____.

2. The finger-like projections on the inner wall of the small intestine that increase absorption are called _____.

3. Grass-eating animals digest cellulose with the help of _____ living in their stomach.

4. In humans, the exchange of gases takes place in the tiny air-sacs of the lungs called _____.

5. The removal of undigested food from the body is called _____.

Section C — True or False (1 × 5 = 5)

1. Digestion of food begins in the stomach. (True / False)
2. Amoeba digests its food inside a food vacuole. (True / False)
3. Insects such as the cockroach breathe through gills. (True / False)
4. The liver is the largest gland in the human body. (True / False)
5. The use of absorbed food by the body cells to release energy is called egestion. (True / False)

Section D — Match the Columns (1 × 4 = 4)

Column A	Column B
1. Liver	a) absorption of digested food
2. Villi	b) breathing in fish
3. Gills	c) secretes bile
4. Saliva	d) begins the digestion of starch

Section E — Assertion–Reason (1 × 3 = 3)

Choose: (A) both A and R true and R explains A; (B) both true but R does not explain A; (C) A true, R false; (D) A false, R true.

1. **Assertion (A):** The small intestine is very long and lined with villi.
Reason (R): This gives a large surface area for the absorption of digested food.
2. **Assertion (A):** Ruminants such as cows can survive on grass alone.
Reason (R): Bacteria in their stomach digest the cellulose in grass.
3. **Assertion (A):** We should chew our food thoroughly before swallowing.
Reason (R): Chewing stops the action of saliva on the food.

Answer Key

Multiple Choice Questions

- | | | | | |
|------|------|------|------|------|
| 1. D | 2. B | 3. A | 4. C | 5. D |
| 6. A | 7. C | 8. B | | |

Fill in the Blanks

1. oesophagus (food pipe)
2. villi
3. bacteria (microbes)
4. alveoli
5. egestion

True or False

1. False
2. True
3. False
4. True
5. False

Match the Columns

1-c, 2-a, 3-b, 4-d

Assertion–Reason

1. A
2. A
3. C
