

Life Processes in Animals

Science — Biology · Class 7 · Max Marks: 34 · Time: 1 hour

Section A — Very Short Answer ($1 \times 5 = 5$)

1. Name the projections that increase absorption in the small intestine. [1]
2. Name the organ that produces bile. [1]
3. Name the respiratory organ of a fish. [1]
4. What is the partly digested food that ruminants chew again called? [1]
5. Name the process by which absorbed food is used by the body cells. [1]

Section B — Short Answer ($2 \times 5 = 10$)

1. Differentiate between ingestion and egestion. [2]
2. Why is the small intestine long and provided with villi? [2]
3. How does an Amoeba obtain and digest its food? [3]
4. Why can a cow digest grass while a human being cannot? [2]
5. Name any two respiratory organs found in different animals and state one animal that uses each. [2]

Section C — Long Answer ($5 \times 3 = 15$)

1. Describe the five steps of nutrition in animals, writing one line about each. [5]
2. Trace the path of food through the human alimentary canal, naming the main organs and the job of each. [5]
3. Explain how the exchange of gases takes place in humans during breathing. [5]

Section D — Higher-Order Thinking (Give Reasons) ($2 \times 2 = 4$)

1. A person has had part of the small intestine removed. Explain why they may become weak even though they eat enough food. [2]
2. Earthworms breathe through their moist skin. Explain why they come out of the soil during heavy rain. [2]
