

Life Processes in Animals

Science — Biology · Class 7 · Max Marks: 17 · Time: 45 min

Section A — Multiple Choice (Higher Order) (1 × 14 = 14)

1. If the villi of the small intestine were badly damaged, the process most directly affected would be:

- A. digestion
- B. absorption
- C. ingestion
- D. egestion

2. A tapeworm lives in the human intestine and soaks up the already-digested food, having no digestive system of its own. Its mode of nutrition is:

- A. parasitic
- B. insectivorous
- C. saprotrophic
- D. autotrophic

3. The substance in saliva begins the digestion of:

- A. fats
- B. minerals
- C. proteins
- D. starch (carbohydrates)

4. Which path correctly traces a bite of bread through the body?

- A. mouth → small intestine → stomach
- B. stomach → mouth → intestine
- C. mouth → oesophagus → stomach → small intestine → large intestine
- D. mouth → stomach → oesophagus → small intestine

5. A cow's stomach has four chambers while a tiger's has one, mainly because the cow must digest:

- A. cellulose-rich grass
- B. meat
- C. large amounts of water
- D. bones

6. During heavy exercise we breathe faster chiefly to:

- A. absorb more water
- B. take in more oxygen and remove more carbon dioxide
- C. cool the body
- D. digest food faster

7. Amoeba does not need lungs or gills because:

- A. it breathes through villi
- B. gases diffuse directly across its cell surface
- C. it does not respire at all
- D. it lives without oxygen

8. Which pair of animal and respiratory organ is correct?

- A. cockroach – tracheae
- B. earthworm – gills
- C. adult frog – gills only
- D. fish – lungs

9. Bile contains no enzyme, yet it helps fat digestion by:

- A. breaking fat chemically
- B. breaking large fat drops into tiny droplets so enzymes act faster
- C. absorbing the fat
- D. turning fat solid

10. If the liver stops making bile, the digestion of ____ will be most affected:

- A. water
- B. proteins
- C. fats
- D. starch

11. The chief job of the large intestine is to:

- A. produce bile
- B. carry out breathing
- C. digest proteins
- D. absorb water from the undigested food

12. A fish taken out of water soon dies because its gills:

- A. freeze solid
- B. get too cold
- C. collapse and cannot take oxygen from air
- D. absorb too much oxygen

13. Animal A has a four-chambered stomach and chews cud; animal B swallows its prey whole. A and B are respectively:

- A. cow and snake
- B. both cows
- C. tiger and cow
- D. snake and cow

14. The main reason humans cannot live on grass like cattle is that humans lack:

- A. saliva
- B. teeth
- C. a stomach
- D. the microbes that digest cellulose

Section B — Assertion–Reason (1 × 3 = 3)

Choose: (A) both A and R true and R explains A; (B) both true but R does not explain A; (C) A true, R false; (D) A false, R true.

1. **Assertion (A):** The inner wall of the small intestine bears millions of villi.

Reason (R): Villi increase the surface area for the absorption of digested food.

2. **Assertion (A):** Earthworms crawl out to the surface during heavy rain.

Reason (R): Waterlogged soil has little air, so they come up to breathe.

3. **Assertion (A):** Fish can breathe while staying under water.

Reason (R): Gills take up the oxygen dissolved in the water.

Answer Key

Multiple Choice (Higher Order)

- | | | | | |
|-------|-------|-------|-------|-------|
| 1. B | 2. A | 3. D | 4. C | 5. A |
| 6. B | 7. B | 8. A | 9. B | 10. C |
| 11. D | 12. C | 13. A | 14. D | |

Assertion–Reason

- 1. A
- 2. A
- 3. A
